Dear Hiring Manager,

I am applying for the Data Engineer Intern/Co-op role because Plymouth Rock's Enterprise Advanced Analytics team is working on the kind of data engineering I have been building toward: modernizing legacy pipelines, making insurance data reliable, and preparing curated datasets that data science teams can actually trust. My closest experience is from AAIS, where I worked on production insurance data workflows using Python, SQL, PySpark, AWS Glue, S3, IAM, MySQL, Oracle, Impala, PostgreSQL, JDBC, and Semarchy MDM. I automated a manual billing process over 20+ TB of golden-table insurance data for 700+ member companies, helped replace legacy Pentaho workflows with AWS Glue and partitioned S3 pipelines, and built validation and access-control patterns around downstream data use.

What I like about this role is that it is practical data engineering rather than abstract tooling: ingestion from internal and third-party systems, repeatable cloud workflows, data quality checks, documentation, and datasets that support advanced analytics. That matches how I tend to work. I like understanding source systems, writing Python/SQL that can be rerun safely, validating data before it is handed off, and documenting the workflow so other engineers and data scientists can build on it. I would bring insurance-domain context, hands-on AWS data pipeline experience, and a careful software engineering mindset to help Plymouth Rock modernize data pipelines that support analytics, operational excellence, and research initiatives.

Best regards,
Aryan Miriyala
