Dear Jobright Hiring Team,

I am applying for the AI Engineer, Entry Level role because Jobright is building exactly the kind of AI product I want to work on: a practical agent that helps people navigate a high-friction real-world workflow. I am drawn to products where LLMs are not just demos, but part of an application that has to understand user intent, retrieve the right context, produce reliable answers, and connect cleanly to the user experience.

My background fits that intersection of applied AI and product engineering. I have built LLM and RAG systems with Python, OpenAI API, LangChain, Mistral AI, Gemini, ChromaDB, semantic retrieval, and structured evaluation, including a diff-grounded PR generation pipeline, a source-grounded campus search prototype, and a full-stack AI feedback platform. At SmartSolve, I use Codex and Claude Code for AI-assisted planning, debugging, and review while building secure internal software with Next.js, TypeScript, PostgreSQL, SSO, auth middleware, Docker, and Git. I would bring Jobright a builder's mindset: ship useful AI-driven features, keep responses grounded and reviewable, bridge AI logic with product interfaces, and improve quickly in a small ownership-heavy team.

Best regards,
Aryan Miriyala
