Dear Hiring Manager,

I am applying for the Graduate Software Engineer role at Fuze Health because the work connects directly with the kind of engineering I want to keep doing: building reliable software and data systems for digital health, remote care, and healthcare operations. My strongest connection to this space comes from my internship with Alliance for Paired Kidney Donation, where I worked on an AWS-hosted Lucee/CFML healthcare workflow platform supporting internal transplant operations. That experience showed me how much careful engineering matters in healthcare software: secure forms, audit logging, reliable data entry, clear access handling, and fast troubleshooting all affect the people and teams relying on the system.

I also bring cloud/data and full-stack experience that fits the role's focus on product engineering, complex data environments, bug fixing, documentation, and cross-functional problem solving. At AAIS, I automated a manual SQL billing workflow with Python, PySpark, and AWS Glue across 20+ TB of production insurance data, built validation and reverse-ETL workflows, and worked with AWS Lambda, S3, IAM, Oracle, PostgreSQL, and JSON pipelines to support standardized downstream data flows. Across my internships and projects, I have built the habit Fuze is looking for: investigate messy system behavior, trace issues to root causes, communicate findings clearly, and turn that understanding into maintainable software improvements. I would be excited to bring that healthcare workflow context, AWS/data engineering background, and full-stack development experience to Fuze's technology team.

Best regards,  
Aryan Miriyala
