Dear Sela AI Hiring Team,

Sela stands out to me because it is applied AI under real production pressure: voice agents that have to work at high volume, stay low-latency, respect enterprise privacy and security, and prove quality through simulation, evaluation, and reliability in production. That is the kind of AI work I am most interested in - not demos for their own sake, but software that can own a real workflow end to end and create measurable value. My background fits that direction through AI-assisted engineering at SmartSolve, where I use Codex and Claude Code for implementation planning, debugging, and self-review while building secure internal tools with Next.js, TypeScript, PostgreSQL, Drizzle ORM, SSO, auth middleware, and Docker based development environments.

I would bring Sela a mix of applied AI judgment, full-stack/backend engineering, and reliability-minded production experience. My LLM research project generated evidence-grounded pull request descriptions from commits, diffs, linked issues, and repository metadata with automated evaluation against code-change evidence, which maps closely to Sela's focus on agent evaluation and quality. At AAIS, I automated production data workflows with Python, PySpark, AWS Glue, Lambda, S3, and SQL at multi-terabyte scale, and at Alliance for Paired Kidney Donation I improved an AWS-hosted healthcare workflow platform through anti-CSRF protection, audit logging, access-control routing, form modernization, and reliability fixes. I am excited by the chance to join a high-agency engineering team building the infrastructure around AI agents, and I would want to contribute with clean implementation, careful technical communication, and ownership from architecture through production behavior.
