Dear Hiring Manager,

I am applying for the Data Engineer role on The Hartford's Actuarial Strategic Modeling team because it sits at the exact intersection where my strongest experience has been developing: insurance data engineering, cloud data pipelines, data quality, and ML/AI-ready data assets. My closest connection to this work comes from AAIS, where I built production insurance data workflows with Python, PySpark, AWS Glue, S3, IAM, SQL, Oracle, Impala, PostgreSQL, and Semarchy MDM. I automated a fully manual SQL billing process across 20+ TB of golden-table data for 700+ member companies, profiled and mapped 160+ source tables into 25 MDM domains, and helped replace legacy Pentaho jobs with maintainable cloud ETL and validation workflows.

What draws me to this role is the chance to work on data assets that have to be technically reliable and business-useful at the same time. The Hartford's focus on actuarial modeling, continuous data delivery, and AI/ML solutions matches the kind of engineering habits I have built across internships and projects: understand messy source systems, validate the quality and lineage of data, automate repeatable pipelines, document work clearly, and hand off reproducible artifacts that data science and business teams can trust. I would bring insurance-domain context, Python/SQL/PySpark/AWS experience, and a practical software engineering mindset to help The Hartford build sustainable data pipelines for analytics, modeling, and business decision-making.

Best regards,
Aryan Miriyala
