Dear MeritFirst Team,

What stands out to me about MeritFirst is the focus on seeing what early-career engineers can actually build. That resonates with me because most of my strongest experience has come from taking messy, practical problems and turning them into working systems: secure internal tools at SmartSolve, production data automation at AAIS, reliability fixes for a healthcare workflow platform at APKD, and personal projects where I owned the full path from idea to implementation. I like environments where the work sample matters because it makes the conversation more honest: can I understand the problem, write working code, debug it, explain tradeoffs, and keep improving?

I would bring a broad builder's foundation across Python, TypeScript, C++, SQL, React, Next.js, Node.js, PostgreSQL, MongoDB, Docker, and AWS. I have built full-stack products like RocketGrader and Travel Health Advisor, automated multi-terabyte production data workflows with Python/PySpark/AWS Glue, implemented RBAC/JWT and auth patterns, and pushed through a self-adaptive C++/OpenMP scheduling project that taught me how to reason from measurement instead of assumptions. I am interested in MeritFirst because it points toward the kind of engineering career I want: shipping real code, learning quickly from strong engineers, taking feedback seriously, and proving fit through the quality of what I build.
