Dear Podium Hiring Team,

Podium stands out to me because the product sits at the point where AI has to be useful in real customer conversations, not just impressive in a demo. The idea of AI Employees helping local businesses capture leads, respond faster, and turn everyday communication into business outcomes connects closely with the kind of software I like building: systems that take messy workflows and make them easier for people to act on. My recent work has been in that direction, from using Codex and Claude Code while building secure internal tools at SmartSolve to building AI-powered projects like DreamScape, RocketGrader, Travel Health Advisor, and my diff-grounded PR generation research.

I would bring Podium a practical mix of full-stack engineering, backend/data systems, AI-assisted development, and production-minded debugging. At SmartSolve I built Next.js, TypeScript, PostgreSQL, Drizzle ORM, SSO, and Docker-based tooling for internal workflows; at AAIS I automated production data workflows with Python, PySpark, AWS Glue, Lambda, S3, SQL, and role-based access patterns; and at APKD I improved an AWS-hosted healthcare workflow platform through anti-CSRF protection, audit logging, form modernization, and reliability fixes. I am especially interested in this internship because it offers real production systems, AI-powered customer engagement, code review, testing, and ownership in a fast-moving environment where the work directly affects customers.
