Dear Hiring Manager,

I am applying for the Software Engineer I role at Uber because the role matches the kind of engineering I want to grow into: building backend and full-stack systems that are reliable, scalable, and useful in real-world operations. Uber's platform operates at a scale where software affects movement, marketplace efficiency, product reliability, and day-to-day business operations, which is exactly the kind of environment where I want to deepen my skills in backend development, APIs, debugging, system design, and engineering productivity.

My experience has prepared me for that kind of work across internships and projects. At SmartSolve, I built secure internal software with Next.js, TypeScript, PostgreSQL, Drizzle ORM, SSO/auth middleware, and Docker-based development environments. At AAIS, I built Python and SQL automation, contributed to React/Node.js modernization with RBAC and JWT access controls, and developed AWS Lambda/S3 workflows that supported production data validation and downstream systems. At Alliance for Paired Kidney Donation, I worked on an AWS-hosted healthcare workflow platform where I secured forms, improved auditability, and debugged reliability issues across imports, file paths, page crashes, and reusable UI workflows. I would bring that mix of backend/API experience, production-minded debugging, secure system design, and systems-level curiosity to Uber's engineering team.

Best regards,
Aryan Miriyala
