Dear Adobe Hiring Team,

I am applying for the Software Development Engineer role because Adobe builds products that help people turn ideas into creative, useful, and personalized experiences at a massive scale. That connects closely with the kind of software work I have been drawn to: building practical tools, improving messy workflows, and using AI carefully to help people create, learn, and work more effectively.

My background matches the role's focus on reliable, maintainable software across design, coding, review, testing, debugging, and collaboration. At SmartSolve, I built secure internal software with Next.js, TypeScript, PostgreSQL, SSO, auth middleware, and Docker-based development environments while using Codex and Claude Code for planning, debugging, and review. At AAIS, I built Python/SQL automation across MySQL, Oracle, and PostgreSQL systems, contributed to React/Node.js RBAC and JWT modernization for roughly 110 internal users, and automated AWS Lambda/S3 validation workflows. I have also built full-stack projects with Angular, React, Express, MongoDB, Auth0, C++ systems work, and AI-assisted feedback and productivity workflows. I would bring Adobe a strong early-career engineering foundation, clear communication, and a practical focus on quality, debugging, and building software that helps users make ideas real.

Best regards,
Aryan Miriyala
