Dear Figma Hiring Team,

I am applying for the Software Engineer, Full Stack role because Figma's work connects product craft with the systems work needed to help teams collaborate in real time. The role's mix of user-facing product development, scalable backend systems, developer workflows, AI-assisted iteration, and cross-functional collaboration maps closely to the kind of engineering I have been building toward: shipping practical software that is polished enough for users, maintainable enough for teams, and reliable enough for operational workflows.

My strongest fit is full-stack product engineering backed by production-minded data and reliability experience. At SmartSolve, I built secure internal product workflows with Next.js, TypeScript, PostgreSQL, Drizzle ORM, SSO, auth middleware, and Docker-based developer environments while using Codex and Claude Code for implementation planning, debugging, and review. At AAIS, I built Python/SQL automation across MySQL, Oracle, and PostgreSQL systems, contributed to React/Node.js RBAC and JWT modernization for roughly 110 internal users, and automated AWS Lambda/S3 validation workflows for downstream systems. I have also built user-facing projects with React, Express, MongoDB, AI-assisted workflows, generated PDFs, role-based dashboards, mobile TypeScript state, and source-grounded LLM evaluation. I would bring Figma a practical full-stack mindset: care about the user experience, keep APIs and data flows clear, use AI tools with judgment, and improve the systems I ship after launch.

Best regards,
Aryan Miriyala
