Dear Hiring Manager,

I am applying for the AI-First Software Engineer role because Nymbus is describing the way I already like to build: use AI as a serious engineering tool, move quickly, but still care about correctness, readability, and long-term maintainability. In my current SmartSolve internship, I use Codex and Claude Code for planning, implementation, debugging, code review, and self-review while validating the output myself instead of treating AI as a shortcut. I have also built secure internal software with Next.js, TypeScript, PostgreSQL, Drizzle ORM, SSO, and auth middleware, plus a Docker devcontainer that made AI-assisted development more reproducible across environments.

The fintech and banking modernization side of Nymbus is also compelling because my strongest production experience has been in insurance data and internal platforms, where reliability, access control, and business-facing systems matter. At AAIS, I built Python/SQL automation, AWS data workflows, React/Node.js access-control improvements, and validation pipelines used around production insurance data. My projects add the AI-product layer: RocketGrader, FalconGraph, Travel Health Advisor, and my LLM PR-generation research all required turning ambiguous ideas into working software with APIs, databases, retrieval, LLM calls, and user-facing workflows. I would bring Nymbus a builder mindset that is AI-native, practical, and careful about when to trust generated code and when to override it.

Best regards,
Aryan Miriyala
