Dear Hiring Manager,

I am applying for the Jr. AI Engineer role at Ursa Space Systems because the role matches the kind of AI engineering I am most interested in: using AI as a serious engineering accelerator while keeping human judgment, traceability, and software quality at the center. Ursa's work turning satellite and spatial data into decision-ready GeoAI insight is especially interesting to me because it combines complex data, operational decision support, and applied AI in a way that has to be both useful and accountable. I am drawn to that balance: building systems where AI helps people move faster, but where the engineer still owns the quality, risk, and reliability of what ships.

My background fits that human-on-the-loop model through both practical software work and LLM focused research. At SmartSolve, I use Codex and Claude Code in AI-assisted engineering workflows while building internal software with Next.js, PostgreSQL, Drizzle ORM, SSO/auth middleware, and Docker based development environments. In my LLM research project on diff-grounded pull request description generation, I built a Python pipeline using the OpenAI API, GitHub API, repository artifacts, file diffs, structured context, grounding constraints, and automated LLM evaluation to generate human-reviewable software documentation from code-change evidence. That combination of AI-first development, software quality, evaluation, secure tooling, and disciplined review is what I would bring to Ursa as I grow into a professional AI engineer.

Best regards,
Aryan Miriyala
